Stacks and Queues

C.S. Marron cmarron@umbc.edu

CMSC 341 — Data Structures

(ロ)、(型)、(E)、(E)、 E) の(()

Abstract Data Types

ADT Definition

- 1. Abstract model for a data type
- 2. Defined by behavior (semantics)
- 3. From the *user* point-of-view

This is in contrast to *Data Structures* which are representations of data from the *implementer* point-of-view.

Sparse Vector ADT

Example

A *sparse vector* is an ADT. We have expectations of how we can interact with a sparse vector as a user, but we don't need to know how it is implemented. We saw that it could be implemented with either an array or linked list data structure.

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

1. push(e): place the element *e* on the stack

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

- 1. push(e): place the element *e* on the stack
- pop(): return the element most recently placed on the stack and remove it from the stack

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

- 1. push(e): place the element *e* on the stack
- pop(): return the element most recently placed on the stack and remove it from the stack
- top(): return the element most recently placed on the stack, but do not remove it from the stack

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

- 1. push(e): place the element *e* on the stack
- pop(): return the element most recently placed on the stack and remove it from the stack
- top(): return the element most recently placed on the stack, but do not remove it from the stack

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Definition

A Stack is a last-in, first-out (LIFO) ADT that supports the following operations:

- 1. push(e): place the element *e* on the stack
- pop(): return the element most recently placed on the stack and remove it from the stack
- top(): return the element most recently placed on the stack, but do not remove it from the stack

Stacks may provide additional operations such as size() and empty().

Stack Implementation

Array or List?

1. How can we implement the Stack ADT with an array?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- 2. How can we implement it with a linked list?
- 3. What is the running time of the CRUD operations?
- 4. Are the implementations memory-efficient?
- 5. Which do you prefer and why?

Definition

A Queue is a first-in, first-out (FIFO) ADT that supports the following operations:

Definition

A Queue is a first-in, first-out (FIFO) ADT that supports the following operations:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

1. enque(e): place the element e in the queue

Definition

A Queue is a first-in, first-out (FIFO) ADT that supports the following operations:

- 1. enque(e): place the element e in the queue
- 2. dequeue(): return the element that has been in the queue the longest and remove it from the queue

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Definition

A Queue is a first-in, first-out (FIFO) ADT that supports the following operations:

- 1. enque(e): place the element e in the queue
- 2. dequeue(): return the element that has been in the queue the longest and remove it from the queue
- 3. front(): return the element that has been in the queue the longest, but do not remove it from the queue

Definition

A Queue is a first-in, first-out (FIFO) ADT that supports the following operations:

- 1. enque(e): place the element e in the queue
- 2. dequeue(): return the element that has been in the queue the longest and remove it from the queue
- 3. front(): return the element that has been in the queue the longest, but do not remove it from the queue

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Stacks may provide additional operations such as size() and empty().

Queue Implementation

Array or List?

1. How can we implement the Queue ADT with an array?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- 2. How can we implement it with a linked list?
- 3. What is the running time of the CRUD operations?
- 4. Are the implementations memory-efficient?
- 5. Which do you prefer and why?

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

 insertFront(e): place the element e at the front of the dequeue

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue
- 4. eraseBack(): remove the item at the back of the dequeue

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue
- 4. eraseBack(): remove the item at the back of the dequeue

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

5. front(): return the element at the front of the dequeue

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue
- 4. eraseBack(): remove the item at the back of the dequeue
- 5. front(): return the element at the front of the dequeue
- 6. back(): return the element at the back of the dequeue

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue
- 4. eraseBack(): remove the item at the back of the dequeue
- 5. front(): return the element at the front of the dequeue
- 6. back(): return the element at the back of the dequeue

Definition

A Dequeue is a combination of a queue and a stack. It supports the following operations:

- insertFront(e): place the element e at the front of the dequeue
- insertBack(e): place the element e at the back of the dequeue
- 3. eraseFront(): remove the item at the front of the dequeue
- 4. eraseBack(): remove the item at the back of the dequeue

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- 5. front(): return the element at the front of the dequeue
- back(): return the element at the back of the dequeue
 Dequeues may also provide size() and empty().

Your book says this is pronounced like "deck" to avoid confusion with the dequeue() operator for queues. I've never liked that. How about...

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Your book says this is pronounced like "deck" to avoid confusion with the dequeue() operator for queues. I've never liked that. How about...

Since it's two-ended, we could just as well call it a bi-queue and pronounce it "bike"

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Your book says this is pronounced like "deck" to avoid confusion with the dequeue() operator for queues. I've never liked that. How about...

- Since it's two-ended, we could just as well call it a bi-queue and pronounce it "bike"
- Since it's a combination of a queue and a stack, how about "quest?"
- I don't think either will catch on, so it's safer to stick with "deck."

Read the following sections in the textbook

- 1. Section 5.1: Stacks; including the applications in 5.1.6 and 5.1.7
- 2. Section 5.2: Queues
- 3. Section 5.3: Double-Ended Queues; omit Adapters (5.3.4)
